CHALMERS, GÖTEBORGS UNIVERSITET

EXAM for DYNAMICAL SYSTEMS

COURSE CODES: TIF 155, FIM770GU, PhD

Time: August 16, 2017, at $08^{30} - 12^{30}$

Place: Johanneberg

Teachers: Kristian Gustafsson, 070-050 2211 (mobile), visits once at 09³⁰

Allowed material: Mathematics Handbook for Science and Engineering

Not allowed: any other written material, calculator

Maximum score on this exam: 12 points (need 5 points to pass).

Maximum score for homework problems: 24 points (need 10 points to pass).

CTH \geq 20 passed; \geq 27 grade 4; \geq 32 grade 5,

GU \geq 20 grade G; \geq 29 grade VG.

- 1. Short questions [2 points] For each of the following questions give a concise answer within a few lines per question.
 - a) Give a definition for what a dynamical system is.
 - b) A nonautonomous system can be written as

$$\dot{\boldsymbol{x}} = \boldsymbol{f}(\boldsymbol{x}, t) \,,$$

i.e. the flow ${\pmb f}$ depends explicitly on time. Is a nonautonomous system a dynamical system? Explain your answer.

- c) What does a transcritical bifurcation mean?
- d) What are the stable manifolds of a fixed point?
- e) Give an example of how the knowledge of stable manifolds of a fixed point could be used to understand the dynamics in a dynamical system.
- f) What is a quasiperiodic flow? Give an example!
- g) In the problem sets the Lyapunov exponents were evaluated using a QR-decomposition method. Why is this method preferred over direct numerical evaluation of the eigenvalues of M^TM where M is the deformation matrix, or over evaluation of the Lyapunov exponent using separations between a number of particles?
- h) Sketch the typical shape of the generalized dimension spectrum D_q against q for a mono fractal and for a multi fractal.

2. Quadfurcation [2 points]

- a) Give/construct an example of a one-dimensional dynamical system showing a pitchfork bifurcation as a parameter r passes 0.
- b) Sketch the bifurcation diagram for your system in subtask a).
- c) Pitchfork bifurcations are examples of 'trifurcations', meaning a division into three branches of fixed points as r passes 0. Construct an example of a 'quadfurcation', in which no fixed points exist for r < 0 and four fixed points exist for r > 0.
- d) Sketch the bifurcation diagram for your system in subtask c).
- 3. Phase portrait [2 points] Consider the system

$$\dot{x} = x(ax - y)
\dot{y} = y(2x - y).$$
(1)

- a) Find all fixed points of the system (1).
- b) What does linear stability analysis predict about the fixed point(s)?
- c) For a=2, sketch the nullclines and the phase-plane dynamics (phase portrait) in the region $-2 \le x \le 2$ and $-2 \le y \le 2$.
- **4.** Trapping regions for the van der Pol oscillator [2 points] Consider the van der Pol equation

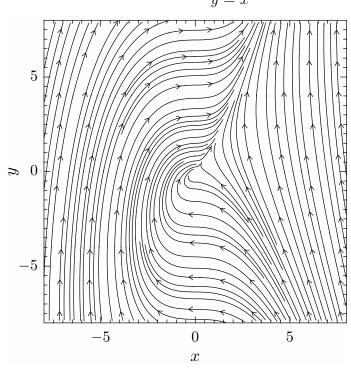

$$\ddot{x} + \mu(x^2 - 1)\dot{x} + x = 0 \tag{2}$$

with μ a real parameter.

- a) Give physical interpretations or explanations of the different terms in Eq. (2).
- b) Consider the dynamics in the phase-plane (x, y) with $y = \dot{x}$. Knowing that this dynamical system shows an attractive limit cycle when $\mu > 0$, show that it has a repelling limit cycle when $\mu < 0$.
- c) Let $r = \sqrt{x^2 + y^2}$ and derive an equation for \dot{r} in terms of x and y.
- d) When $\mu < 0$, show that there exist 'trapping regions' in the form of circles of radii $r < r_{\rm c}$ such that all solutions starting from initial conditions inside these circles tend to the origin. Determine $r_{\rm c}$.

- **5. Indices and bifurcations [2 points]** The phase portraits of two dynamical systems are plotted in subtasks a) and b) below.
 - a) What is the index of the fixed point of the following dynamical system?

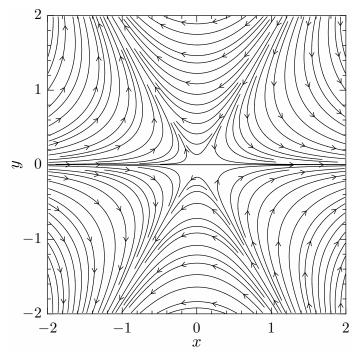

$$\dot{x} = y - x$$
$$\dot{y} = x^2$$

b) What is the index of the fixed point of the following dynamical system?

$$\dot{x} = x^2 - y^2$$

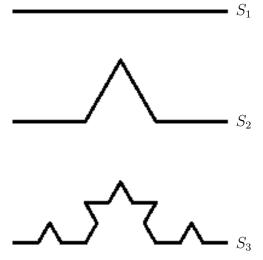

$$\dot{y} = -2xy$$

c) Add a perturbation term μ to the x-component of the flow in subtask b). Describe the bifurcation (if any) that occurs when μ passes through zero in the perturbed system:

$$\dot{x} = x^2 - y^2 + \mu$$
$$\dot{y} = -2xy.$$

- d) Is the bifurcation in subtask c) consistent with the indices of involved fixed points and with the result you obtained in subtask b)?
- **6. Box-counting dimension [2 points]** The two figures below show the first few generations in the construction of two fractals. The fractal set is obtained by iterating to generation S_n with $n \to \infty$.
 - a) Analytically find the box-counting dimension D_0 (explicitly if possible, otherwise implicitly) of the Koch curve, obtained by at each generation replacing the middle third interval of all lines of length L with two new lines. The two replacing lines both have length L/3 and form a wedge:

b) Analytically find the box-counting dimension D_0 (explicitly if possible, otherwise implicitly) of the fractal constructed by infinite iteration of the sequence illustrated below:
